Provides a hardware and software evaluation platform for development of the RF Solutions GPS/PVT module. This module provides position, velocity and time information in a standard NMEA string format that is compatible with a range of GPS driven navigation packages including Microsoft AUTOROUTE. The evaluation board provides a completed design utilizing the GPS Module. This provides a direct PC interface via 9 way D type connector and a row of pin headers to enable configuration and monitoring of the GPS signals. Power may be from any DC supply from 3.3~15V. Two LEDs provide additional information relating to the signal lock and validity of the onboard almanac.

Features:

• Standard RS232 Data Output Via 9-Way D Type Connector • Data In Standard NMEA Format • Supplied with GPS Antenna, Supporting Software, RS232 Cable (for PC Connection) • LED Indicators for Valid Almanac and Signal Lock • Link Selectable and Programmable Baud Rates • Onboard Regulator Allows 3.3 ~ 15V Supply • Compatible with Popular Routing Software

RF Encoder/Decoder Chipset

The RF Solutions RF600E and RF600D are easy to use encoder and decoder ICs. They have been designed to achieve the maximum possible range from any radio/InfraRed transmitter/receiver set. Unlike other encoder/decoder devices, the RF600E/600D provide an unprecedented level of security which prevents copying or grabbing while also obtaining optimum range from the transmitter and receiver.

Features: Highly secure KEELOQ® protocol • Simple to use • Stand Alone operation • Achieves maximum range from RF modules • Decoder serial output • LED indication of transmission • Directly compatible with KEELOQ® decoder • Easy learn feature of transmitters

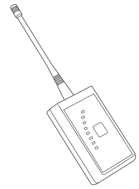
RF600E-ND	Transmitter/Encoder 8-DIP	**$2.86**

Hand Held RF Meter



A miniature RF meter which can be used to show the presence of a radio signal. Briefly press the power switch and the LED bargraph shows RF activity within the local environment. The peak signal is held for 1 second. This can be invaluable when installing a radio system to determine if other RF signals are present (interference) and also validate the signal strength of the radio transmitter to be installed.

RFID Evaluation Kit

The DEMOKITCRX14 tools are designed to demonstrate the STMicroelectronics short range product range that includes the SR176, SRIX512 and SRIX4K products.

The SR176 / SRIX512 / SRIX4K is s contactless memory, powered by a transmitted carrier radio wave at 13.56MHz. It contains a 176-bit (SR176), 512-bit (SRIX512) or 4096-bit (SRIX4K) EEPROM, with memory mapping organized as blocks of 16 or 32 bits. It conforms to the ISO 14443-B recommendation for the transfer of power and signals via radio transmission. The DEMOKITCRX14 reader circuitry amplitude modulates (10% modulation) the data on the carrier using amplitude shift keying (ASK). The SR176 / SRIX512 / SRIX4K replies by load modulating the data on the carrier using the BPSK (Bit Phase Shift Keying) coding using the 847kHz sub-carrier. The data transfer rate in each direction is 106 Kbit/ second.

The purpose of the DEMOKITCRX14 program is to give an example of how the interfacing can be achieved. It does not allow the user to evaluate all of the different ISO 14443 modes.

The DEMOKITCRX14 gives access to the full memory mapping. It is possible to read and write into the selected SR176 / SRIX512 / SRIX4K. This release of demonstration software, differentiated for each SR176 / SRIX512 / SRIX4K, allows all of the product features to be exercised.

Kit Includes: • One CD-ROM • One CRX14 board with I^{2}C connector • One USB Transceiver with USB cable • Some SR176 and SRIX4K Samples • Documentation

HF Manual
Antenna Tuner Board

The tuning board is a manually adjustable matching circuit for constructing custom antennas having a transmission frequency of 13.56MHz and an input impedance of 50Ω. Together with an antenna conductor (e.g., the shield of an RF213 cable) it is quite easy to construct antennas of various sizes and shapes.

The antennas are tuned using jumpers and trim capacitors after installing the antenna conductor. After this done the antenna must be continuously matched to its surrounding conditions. If after tuning the antenna is moved to a different position under different ambient conditions, it may have to be recalibrated.

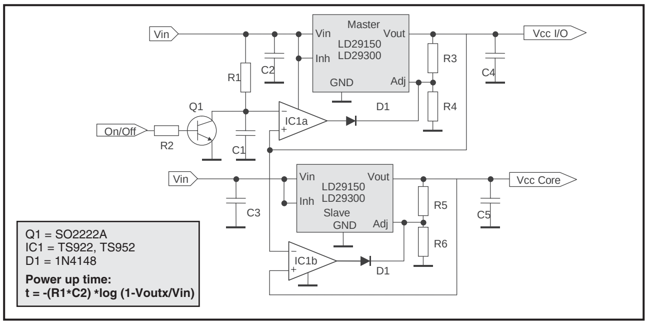
Xilinx FPGA Power Management Systems

Xilinx power supply requirements for the core, I/O, and auxiliary power supplies include voltage outputs ranging from 1.2V to 5V and current outputs from tens of milliamps to multiple amperes. Depending on the system requirements, a linear or a switching regulator may be used to supply power to the FPGA.

STMicroelectronics makes both linear and switching regulators with a wide variety of output voltages and output current levels.
When power sequencing is needed, the following circuit will control the power-up and power-down sequence of the Vcc_{core} and the V_{cco} supply voltages.

Linear regulators are the best choice when board space is at a premium, low output noise is important or a fast response to inputs and transients is required. Linear regulators provide low to medium output currents (up to 3A) with a simple design approach.



Q1 = SO2222A
IC1 = TS922, TS952
D1 = 1N4148
Power up time:
t = -(R1*C2) *log (1-Voutx/Vin)

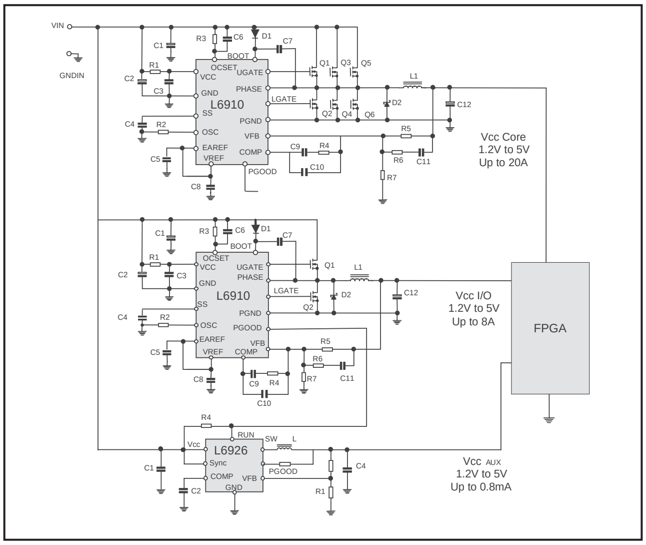
Linear Solution

The above solution implements a controlled slew rate on power up and power sequencing for the core and I/O voltages. Both outputs rise and fall with the same slew rate, set by R1 and C1. t=-(R1*C2) *Log (1 - Vccx/Vin)

Note: Vout Master must be higher than Vout Slave

Switching regulators are best used when design efficiency is critical and/or large output currents are required (such as Spartan-3™ and Virtex-II™). Switching supplies are known for excellent efficiency, but the output is more susceptible to noise due to the switching nature of the regulator.

Switching regulators require inductors and input and output capacitors for DC-DC conversion.



Switching Solution

The above solution provides a Core voltage range from 1.2V to 5V with a current up to 20A, an I/O voltage from 1.2V to 5V with a current capability up to 10A, and an auxiliary supply voltage from 1.2V to 5V up to 800mA.

XILINX® Spartan™ and Virtex Field Programmable Gate Arrays

The Spartan™-3 FPGA family is similar to the Spartan-IIE with increased logic resources, internal RAM capacity, total number of I/Os and overall performance.The **Spartan-XL** family is a high performance FPGA. The **Spartan™-II 2.5V** FPGA family gives users abundant logic resources, and a rich feature set. System performance is supported up to 200 MHz. The **Spartan™-IIE 1.8V** FPGA is similar to the Spartan-II family but operates at a lower voltage.

The **Virtex FPGA** delivers high performance, high capacity solutions. Virtex FPGAs are flexible alternatives to mask programmed gate arrays. System performance up to 200 MHz - 66 MHz PCI Compliant-Hot swappable for Compact PCI.

The **Virtex-E family** is up to 30% faster than the Virtex family. System performance up to 240 MHz using singled ended SelectI/O+™ technology. Virtex-E devices have up to 640 Kb of faster (250 MHz) block SelectRAM+™.

The Virtex-II™ Family features high performance interfaces to external memory and clock management, as well as flexible logic resources.

The Virtex-II Pro FPGA family incorporates embedded PowerPC™ processors and 3.125 Gbps RocketIO serial tranceivers. All Virtex Families are supported by FPGA Foundation™ and Alliance Development Systems.

In-System Programmable CPLDs (Complex Programmable Logic Devices)

The **XC9500** CPLD family provides advanced in-system programming and test capabilities. All devices have a minimum of 10,000 program/erase cycles. Extensive IEEE 1149.1 (JTAG) boundary-scan support is also included on all family members. The XC9500 family is fully pin-compatible allowing easy design migration. Advanced system features include output slew rate control and user programmable ground pins to help reduce system noise. I/Os may be configured for 3.3V or 5V operation. All outputs provide 24mA drive.
The **FastFLASH XC9500XL** family is a 3.3V CPLD family targeted for high-performance, low-voltage applications.

The XC9500XL architectural features address t he requirements of in-system programmability. Each user pin is compatible with 5V, 3.3V, and 2.5V inputs, and the outputs may be configured for 3.3V or 2.5V operation. The XC9500XL device exhibits symmetric full 3.3V output voltage swing.
The CoolRunner™-II device is a 3.3V CPLD targeted at power sensitive designs that require leading edge programmable logic solutions. CoolRunner CPLDs offer a TotalCMOS™ solution, both in process technology and design technique. Xilinx employs a cascade of CMOS gates to implement its sum of products instead of the traditional sense amp approach.

XILINX®

Programmable Gate Arrays

FPGA (Field Programmable Gate Arrays)

A Technical Overview:

Every Xilinx FPGA performs the function of a custom LSI circuit, like a gate array, but the Xilinx device is user-programmable and even reprogrammable in the system.

Xilinx sells standard off-the-shelf devices in many different sizes, speeds, operating temperature ranges and packages.

The user selects the appropriate Xilinx device and then converts the design idea or schematic into a configuration data file, using the Xilinx development ystem software, and loads this file into the Xilinx FPGA.

ALTERA®

CPLDs

Altera's Max families include the cost-optimized MAX 3000 and the high-performance MAX 7000 CPLD's, each of which offers densities, packages and speed grades to meet a variety of design needs. Altera's MAX CPLD's are non-volatile, single-chip solutions that do not require additional configuration devices. This means that they can be pre-programmed and reprogrammed using in-system programmability (ISP) and will retain the programming algorithm securely, even when the device is powered off.

ALTERA®

Configuration Devices

During device operation, Altera® FPGA's store configuration data in SRAM cells. Because SRAM memory is volatile, the SRAM cells must be loaded with configuration data each time the device powers up. You can configure the devices using data stored in an Altera configuration device. Altera configuration devices are offered in different densities and provide a variety of features.

CPLDs (Complex Programmable Logic Devices)

Atmel offers a broad range of high-density, low-power, and cost-effective solutions enabling designers to create products that are "just what the market ordered." Based on a standard architecture, which uses industry standard development tools, Atmel's CPLDs offer the unique low-power or "L" feature while providing 100% connectivity. These devices are processed with Atmel's proprietary 0.65-micron processes and have a EEPROM memory.

The ATF750/C CPLDs are based on a 22V10-type architecture and provide market-leading capacity and flexibility in a 22V10 footprint with twice the registers and additional features for better logic utilization.

The ATF1500 Series is targeted at wider logic density, with higher number of I/O's. This family has devices from 44 to 160 pins, and 32 to 96 I/O's. High connectivity, and flexible architecture make these parts highly suitable for system design. In system programmability in the larger devices allow for reconfiguration even after the device is in the system.

Standard Development Tools:
Atmel's philosophy is that designers should be able to use known development tools. Third-party design tools such as Synario™, ABEL™, CUPL™, PPLDesigner-XL™, LOG/iC™, and PLDSyn™ support Atmel's EPLDs. Also Atmel-specific versions of the popular Synario, ABEL, and CUPL design tools are offered. In addition, workstation support is available on popular platforms with Viewlogic, MINC, Cadence, Mentor, and Synopsys.

ATF15xx-DK2 CPLD Development Kit

The ATF15xx-DK2 is a second generation low-cost development programmer kit for the designer who wishes to begin working with Atmel's ATF15xx family of industry standard pin-compatible Complex Programmable Logic Devices (CPLD) with Logic Doubling™. Like the original ATF15xx-DK, the "DK2" allows designers to design, synthesize, simulate, program and evaluate their designs using their choice of either free Atmel-WinCUPL™ design software or a 30-day free trial version of Atmel-ProChip Designer™ using any 84-pin ATF15xx device, such as those provided with the kit. In addition, the kit can be extended to be used to program all of the Atmel ATF15xx Family with different packages by simply adding the package adapters (only PLCC84 is included in the kit). Once the design is completed, the designer can install a sample ATF15xx Family device in the provided PCB and program it using the built-in In-System-Programmable (ISP) industry-standard 4-pin JTAG interface, ATMISP software, and PC parallel port cable provided. The tutorial included takes the designer through the complete CPLD development process. All software runs on PC Windows™ platforms. In addition, mounting holes are provided to add wire-wrap terminals for all pins to allow comprehensive proto-typing and evaluation. The ATF15xx-DK2 includes everything a designer needs to get started with Atmel-Logic Doubling CPLDs including:

CPLD Demo Board/Programmer Board: • 84-lead PLCC Adapter • ISP (JAT) Port • Wire-wrap Terminal Holes-all Pins • 2 MHz Crystal Oscillator • Eight 8-segment LED Displays • 5V and 3.3V Vcc operation • Easy access to CPLD I/O pins • Global Clear, Output Enable and Power Switches

FPGA's (Field Programmable Gate Arrays)

AT40K Series FPGAs

Atmel's AT40K Series coprocessor FPGAs range from 5K to 50K usable gates, and are designed for high density, compute-intensive DSP and other fast logic designs. The AT40K family sol ves the Logic vs. SRAM trade-off problem by providing fast, flexible, distributed 10ns FreeRAM™ without using valuable logic resources. Structured logic functions, including variable array multipliers can be implemented directly in core cells without using any bussing resources - providing dramatic improvements in speed, utilization, power and system cost.

The AT40K family has the ability to implement Cache Logic design, where part of the FPGA can be reprogrammed without loss of register data, while the remainder of the FPGA continues to operate without disruption. This is ideal for building adaptive filters, variable coefficient multipliers and other designs where the datapath can change to increase system performance.

All Atmel FPGAs can be designed using industry standard CAE tools for schematics, VHDL and Verilog on a PC, Sun, or HP workstation. Software tools are available on Atmel's website at: http://www.atmel.com/fpga_software.html

Features:

- Distributed, single/dual port 10ns SRAM, independent of logic cells
- Up to 384 PCI compliant I/Os
- Mixed 3V/5V capability
- Architecture optimized for efficient, ultrafast array multipliers
- Cache Logic® dynamic full/partial reconfigurability in-system
- Eight global clocks
- Efficient, industry-standard design tools, optimized for synthesis
- QuickChange™ tools for adaptive hardware designs
- Variety of surface mount packages
- All devices in family are pin-compatible

AVR® 8-Bit RISC Microcontrollers

Atmel's new AVR microcontrollers have a RISC core running single cycle instructions and a well-defined I/O structure that limits the need for external components. Internal oscillators, timers, UART, SPI, pull-up resistors, pulse width modulation, ADC, analog comparator and watch dog timers are some of the features you will find in AVR devices. AVR instructions are tuned to decrease the size of the program whether the code is written in C or Assembly. With on-chip in-system programmable Flash and EEPROM, the AVR is a perfect choice in order to optimize cost and get product to the market quickly.

The AVR is a low-power CMOS 8-bit series of microcontrollers based on the AVR RISC architecture. By executing powerful instructions in a single clock cycle, they achieve throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed. The AVR core combines a rich instruction set with the 32 general purpose working registers. All 32 registers are directly connected to the Arithmetic Logic Unit, allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

General Features:

• Utilizes the AVR high-performance and low-power RISC architecture • 32 x 8 general purpose working registers • Programming lock for Flash program and EEPROM data security • Low-power idle and power down modes • External and internal interrupt sources • Low-power, high speed CMOS process technology • Fully static operation

Single-Chip USB to UART Bridge

The CP210x is a single-chip USB to UART bridge that converts data traffic between USB and UART formats. The chip includes a complete USB 2.0 full-speed function controller, bridge control logic and a UART interface with transmit/receive buffers and modem handshake signals.

The device also features on-board EEPROM, a voltage regulator, a USB transceiver and an integrated internal oscillator, eliminating external components generally required in USB applications. System development is further simplified by the CP210xEK evaluation kit, which includes a complete USB to RS-232 evaluation board and royalty-free device drivers for PC and Macintosh platforms.

NEW! Ethernet Controllers

The CP220x is a single-chip Ethernet controller containing an integrated IEEE 802.3-compliant Media Access Controller (MAC), a 10 Base-T Physical Layer (PHY), and 8 kB of non-volatile Flash memory available in either a 28-pin QFN (5 x 5mm), or 48-pin TQFP (9 x 9mm) package.

The on-chip Flash memory may be used to store user constants, web server content, or can be used as general purpose nonvolatile memory. The Flash is factory pre-programmed with a unique 48-bit MAC address stored in the last six memory locations. Having the unique MAC address stored in the CP220x often removes the necessary serialization step from the product manufacturing process of most embedded systems.

Digital Compass Reference Design

The Digital Compass Reference Design is a practical demonstration of Silicon Laboratories' Direct Sensor Interface Technology (DSIT™).

This multi-axis, tilt-compensated electronic compass interfaces very small signals directly to the MCU with no additional instrumentation circuitry, and is based on the C8051F350 MCU, three separate axis of magnetoresistive sensing elements, and a two-axis accelerometer. The highly-integrated C8051F350 results in a single chip solution that accommodates both the sensor interface and the end-user application. The compass reference design includes a user's guide, schematics, USB cable and PC-based GUI software.

ProSLIC®

Subscriber line interface circuit (SLIC), codec and battery generation functionality.

Combined with Silicon Laboratories' Si3201 linefeed integrated circuit, the Si3210 packs maximum performance and flexibility into a 1.5 inch² footprint, making it the smallest single-channel telephony interface available. The integrated battery supply continuously adapts its output voltage to minimize power and enables the entire solution to be powered from a single 3.3V or 5V supply. Software configurable features include 5 REN internal ringing up to 90 VPK, DTMF generation and decoding and a comprehensive set of telephony signaling capabilities for global operation with only one hardware solution. The Si3230 provides the same performance of the Si3201 without the integrated codec.

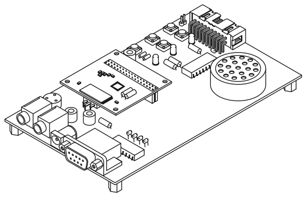
VR Stamp™ Voice Recognition Module



The VR Stamp is the first rapidly deployable speech module to use Sensory's proprietary Quick T2SI™ (text to speaker independent) technology, which allows developers to create working recognition sets in minutes. Multiple languages are supported, making the VR Stamp useful for products virtually anywhere in the world. Based on Sensory's RSC Family of microcontollers, the VR Stamp is a completely modularized, production ready speech recognition system that allows products to speak and hear with minimal development time and low system cost. VR Stamp simplifies the integration of speech recognition into products by combining all key components into a small 40-pin DIP footprint module. A low-noise audio channel and standardized packaging allow rapid prototyping, less debugging and shorter time to market. The VR Stamp offer 24 I/O lines, as well as connections for a power, ground, microphone, speaker and logic-level RS232 interface.

Single-Chip Voice Record/Playback Devices

General Description:
Winbond's patented ChipCorder® technology is a revolutionary multilevel technique to record and play back sound on a single chip. The advanced technology provides natural sound reproduction, in a cost-effective device that retains stored messages in the event of power loss or battery replacement.

The technology, based on a unique multilevel storage approach, stores multiple voltage levels into previously binary, two level EEPROM memory cells. Unlike traditional voice solutions whereby voice is digitized, the Winbond approach stores analog signals directly into single cells as one of over 250 levels.

All ChipCorder products integrate the oscillator, microphone pre-amplifier, automatic gain control, anti-aliasing filter, smoothing filter, and speaker amplifier on-chip to achieve a complete "system on a chip." Only a microphone, speaker, power source, and a few passive components are needed to implement a complete record/playback function.

ISD1100 Series: **Description:** The ISD1100 has been designed for low-cost consumer applications where a bare die is mounted directly to the PC board. The inclusion of pull-up or pull-down resistors on the input pins minimizes the number of signals used and the number of external components or bonding wires required. **Features:** • Pushbutton interface • 5 volt operating range • Automatic power-down

ISD1200 Series: **Description:** The ISD1200 offers a simple push-button interface coupled with the automatic power-down feature. It offers full addressability to handle multiple messages on a single chip. It is ideal for toy applications. **Features:** • 5 volt operating range • Automatic power-down • Fully addressable to handle multiple messages

ISD1400 Series: **Description:** The ISD1400 expands on the simple push-button interface of the ISD1200, with longer storage durations of 16 and 20 seconds. It offers full addressability to handle multiple messages on a single chip and is widely used in communication and consumer applications. **Features:** • 5 volt operating range • Automatic power-down • Fully addressable to handle multiple messages

ISD2500 Series: **Description:** The ISD2500 family offers improvement in speech length up to a maximum of 90 seconds. This extends the single-chip voice solution to industrial and high-end consumer applications. This family offers sound capability for new applications such as cellular phones, answering machines, voice-response faxes, copy machines and industrial applications where voice prompting provides product differentiation for equipment and manufacturers. **Features:** • 5 volt operating range • Fully addressable to handle multiple messages • Directly cascadable for longer durations • Automatic power-down (push-button mode)

ISD400X Series: **Description:** The ISD4000 series provides high-quality, 3-volt, single-chip record/playback solutions for 2 to 4 minutes (ISD4002), 4 to 8 minutes (ISD4003), and 8 to 16 minutes (ISD4004) messaging applications. These CMOS-based devices include an on-chip oscillator, anti-aliasing filter, smoothing filter, AutoMute™ feature, audio amplifier, and high density, multilevel Flash storage array. **Features:** • Single +3 volt supply • Low-power consumption • AutoMute feature to provide background noise attenuation • Fully addressable to handle multiple messages • On-chip clock source • Microcontroller SPI or Microwire™ Serial Interface

ISD5008 Series: **Description:** The ISD5008 device is designed for use in a microprocessor- or microcontroller-based system. Address, control, and duration selection are accomplished through a Serial Peripheral Interface (SPI) or Microwire Serial Interface to minimize pin count. Recordings are stored in on-chip nonvolatile memory cells, providing zero-power message storage. Voice and audio signals are stored directly into solid-state memory in their natural, uncompressed form, providing superior quality voice and music reproduction. **Features:** • Fully-integrated solution • Low-power consumption • Single +3 volt supply • Enhanced voice features • Easy-to-use and control • High quality solution

EconoROM III is designed for quick, in-circuit firmware test cycles. Eliminate the "burn/insert/test/remove/erase" cycle. The ER3 will speed up your firmware development by eliminating the need to remove-erase-program and re-install EPROMs each time you test a code change. These devices plug into the EPROM socket on your target board and emulate the EPROM throughout the development process. **Features:** • Integrated Low-Voltage Support • Target Voltage Sense and Measurement • External Power Option • Jumperless Address Configuration • Up to 8Mbit Emulation in a single unit • Fast Downloads (up to 2.5 Mbit per second) • Replaces standard EPROM device during development • Connects to any Parallel Port • Auto/Manual Target Reset on download • Read-back, Verify and Self-test functions • Daisy-chain cable included • LPT cable (8 wire Modular Cable and DB25 adapter) included • Target cables (standard IDC to DIP Ribbon Cable) included • Includes 2 versions of software: 16 bit DOS version and 32 bit Win9X/NT/2000 version • QuickLoader with Full-screen editor included • Batchable loader and utilities included • Accepts Intel HEX, Tektronix HEX, Motorolla 'S' records and binary files • Free software updates via WEB downloads

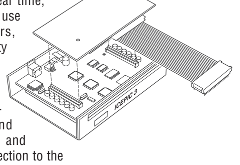
ICEPIC, ICEPIC2 and ICEPIC3 PIC Emulators



ICEPIC, ICEPIC2, and the ICEPIC3 emulators are fully modular, full speed, real time, in-circuit emulator systems, for use with Microchip PIC processors, using interchangeable "personality daughterboards" which connect directly to the users target board and are sold separately. The ICEPIC3 Emulator is compact, portable, lightweight and offers exceptional performance and value. It uses a quick "hot" connection to the host computer via USB Port, with the system firmware being upgraded at any time from the internet giving total upgrade ability. The ICEPIC3 has additional real-time analysis when using the plug-in trace board which is sold separately. All ICEPIC emulators operate within Microchip's MPLAB 32bit IDE giving the user easy control to perform efficient fast emulation. ICEPIC emulators are supplied as complete systems with power supply, cables, manual and a copy of Microchip's MPASM assembler.

XP 4K Series products expand upon ZiLOG's extensive line of 8-bit microcontrollers. The Flash in-circuit programming capability allows for faster development time and program changes in the field. The new eZ8 CPU is upward compatible with existing Z8 instructions. The rich peripheral set of the Z8 Encore! family makes it suitable for a variety of applications including motor control, security systems, home appliances, personal electronic devices and sensors.

Z86CCP01ZEM Emulator / Programmer for Zilog's Z8® Microcontrollers with up to 32K Program Memory

Digi-Key® Part No. **269-2002-ND**
(See Z8 chart for applicable devices.)

GENERAL DESCRIPTION: Zilog's in-circuit emulator/programmer is an interactive, Windows™ based development tool providing a real-time environment for emulation and debugging, which includes a full-featured macro cross assembler to enhance programmer productivity. The Z86CCP01ZEM is a member of Zilog's ICEBOX™ product family of in-circuit emulators providing support for the Z8 microcontrollers. The emulator provides essential timing and I/O circuitry to simplify user emulation of the prototype hardware and software product. The Z8 CCP emulator provides users with a hardware platform to develop and debug software in a real-time environment. In contrast, software simulators provide significantly slower operation making them less practical for code development. The Z8 CCP emulator can be connected to a serial port (COM1, COM2, COM3, and COM4) of the host computer and uses Zilog Developer Studio (ZDS). **Z8 CCP Emulator Kit Contents:** Circuit Board: CMOS Z86C9320VSC, 20MHZ CMOS Z86C5020FSE ICE Chip, 32K x 8 Static RAM (for Code Memory) 18-Pin DIP ZIF Programming Socket, Holes Available for 28/40-Pin ZIF Programming Sockets, Sockets for 28/40-Pin Target Cables, 25-pin RS-232C Interface Connector: 18-Pin DIP Target Cable, Power Cable **Documentation:** Emulator User's Manual ***NOTE:*** *Power Supply RS-232C not included with Z86CCP01ZEM (recommended wall transformer T404-ND)* **FEATURES:** • In-Circuit Debug Emulation • Real-Time Emulation • Z8 GUI ZDS Emulator Software • Window-Based User Interface • On-Line Help • One-Time Programmable (OTP) Support • Selectable Baud Rates: 9600 to 57.6 Kbps • Bisync Error-Correcting Communications Protocol • Source-Level Debugging • Symbolic Disassembly in the Debug Window • Zilog Developer Studio (ZDS): – ZMASM, – Structured Assembly and Data Code, – Source-Level Debug Support, – Built-In Register Equates, – Linker, – Windows 95TM Integrated Editor

Z8® Series Microcontrollers

Z8 MCU Family

OVERVIEW: Zilog MCU products are targeted for cost-sensitive, high-volume applications including consumer, automotive, security, and HVAC. One-time programmable (OTPs) for prototyping as well as volume production where time to market or code flexibility is critical. A variety of packaging options are available. The same on-chip peripherals are used across the MCU product line with the primary differences being the amount of ROM/RAM, number of I/O lines present, and packaging/temperature ranges available. This allows code written for one MCU device to be easily ported to another family member.

FEATURES: • **General-Purpose Register (GPR) File Architecture:** Every RAM register acts like an accumulator, speeding instruction execution and maximizing coding efficiency. Working register groups allow fast context switching. • **Flexible I/O:** I/O byte, nibble, and/or bit programmable as inputs or outputs. Outputs are software programmable as open-drain or push-pull on a port basis. Inputs are Schmitt-triggered with auto latches to hold unused inputs at a known voltage state. • **Analog Inputs:** Three input pins are software programmable as digital or analog inputs. When in the analog mode, two comparator inputs are provided with a common reference input. • **Timer/Counter (T/C):** The T/C consists of a programmable 6-bit prescaler and 8-bit downcounter, with maskable interrupt upon end-of-count. • **Interrupts:** There are six vectored interrupt sources with software-programmable enable and priority for each of the six sources. • **Watch-Dog Timer (WDT):** An internal WDT circuit is included as a fail-safe mechanism so that if software strays outside the bounds of normal operation, the WDT will timeout and reset the MCU. • **Auto Reset:** All family devices have internal Power-On Reset. • **Low-EMI Operation:** Mode is programmable via software or as a mask option. This new option provides for reduced radiated emission via clock and output drive circuit changes. • **Low-Power:** CMOS with two standby modes; STOP and HALT. • **Full Z8 Instruction Set:** Forty-eight basic instructions, supported by six addressing modes with the ability to operate on bits, nibbles, bytes, and words.

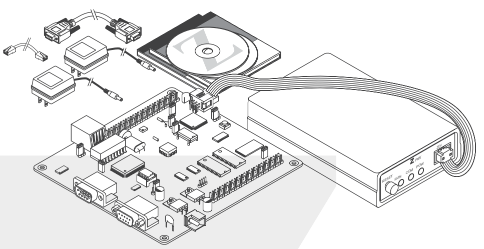
eZ80 - The Next Generation



EZ80190AZ050EC AND EZ80190AZ050SC

Just as the Z80 revolutionized the semiconductor industry, the next generation eZ80 is revolutionizing the way that communications are happening today. This elegant system-on-a-chip can serve web pages over a TCP/IP network, allowing easy system monitoring and control, effortless processor code updates, and system compatibility. This solution enables any browser with access to your network the ability to control and monitor a network application. The eZ80 executes Z80 code four times faster than traditional Z80s at the same clock speed, and can operate at speeds up to 50MHz. Unlike most 8-bit microprocessors, which can only address 64KB, the eZ80 can address 16MB without a Memory Management unit. The eZ80 Webserver also features an Embedded Internet Software Suite that enables the transmission and reception of HTML form data and the dynamic generation of web pages.

FEATURES:
• 50MHz Processor • Multiply and Accumulate Engine • 16MB Linear Addressing • 3.3V Operation • 2 DMA Channels • Universal ZiLOG Interface (selectable UART, IIC, SPI) • 6 PRTs with Prescalers • 8KB SRAM • 32-Bit GPIO with Interrupt Support • On-Chip Oscillator • Optimized Pipeline Architecture • ZiLOG Debug Interface

Z8Plus™ Microcontrollers

Employing the experience gained from the industry-standard Z80 and Z8 cores, the Z8Plus offers increased functionality, significantly higher performance, lower power requirements, and greater cost savings over other 8-bit microcontrollers. The Z8Plus is designed to be easy to use, even for designers who have never used a microcontroller before.

With single-cycle execution, powerful I/O capabilities and register-to-register architecture, the Z8Plus offers state-of-the-art flexibility and freedom for any designer in search of a low-cost solution for a variety of microcontroller applications.

The Z8Plus core offers several significant advantages compared to the current Z8 core. Foremost is performance improvement due to a reduced system clock division and a fixed instruction cycle time. The improvement is nearly 50%, depending upon instruction mix. For example, a Z8Plus-based part at 10MHz has performance comparable to a 16MHz part in production today. This, along with significant design improvements, leads to lower power and lower noise operation.

The Z8PE002 and Z8PE003 microcontrollers are the newest members of the popular Z8E001 Z8 Plus 8-bit microcontroller family. New features include voltage brown-out protection and power-on reset. Additionally, the "RESET" pin has been replaced with a general purpose I/O pin and oscillator circuitry to support RC configurations. These new parts are targeted at customers who require a powerful, yet small OTP microcontroller for use in general purpose applications.

PSoC™ Development Kit

CY3215-DK: The PSoC™ Development Kit includes an In-Circuit Emulator (ICE) which consists of a base unit, USB 2.0 cable, and power supply. The base unit is connected to the host PC via the USB port. The ICE is driven by the Debugger subsystem of PSoC Designer. This software interface allows the user to run, halt and single step the processor. It also allows the user to set complex event points. Event points can start and stop the trace memory on the ICE, as well as break the program execution. In addition to the Development Kit, different Emulation Pods are available to support the range of devices in the PSoC family. The ICE-cube also serves as a single-site device programmer via an ISSP (In-System Serial Programming) Cable and MiniEval board included in the kit. The MiniEval board is a programming and evaluation board which connects to the ICE-Cube via an ISSP Cable and allows programming of DIP devices. There are also other Programming boards available for programming other packages.

CPLDs

Cypress offers a wide range of Programmable Logic Devices From PALs with 10 macrocells and 200 gates up to CPLDs with 3072 macrocells and 200,000 gates.

Cypress also provides voltages ranging from 2.5V up to the typical 5.0V.

The **Cypress PAL SPLDs** are Advanced second-generation PAL architecture. They are CMOS Flash Erasable programmable array logic device. It is implemented with the familiar sum-of-products (AND-OR) logic structure and the programmable macrocell.

The Ultra37000™ family of CMOS CPLDs provides a range of high-density programmable logic solutions with unparalleled system performance. The Ultra37000 family is designed to bring the flexibility, ease of use, and performance of the 22V10 to high-density CPLDs. The architecture is based on a number of logic blocks that are connected by a Programmable Interconnect Matrix (PIM). Each logic block features its own product term array, product term allocator, and 16 macrocells. The PIM distributes signals from the logic block outputs and all input pins to the logic block inputs. All of the Ultra37000 devices are electrically erasable and In-System Reprogrammable (ISR).

The **Delta39K™ ISR™ CPLD** Family based on a 0.18 µm, six-layer metal CMOS logic process, offers a wide range of high-density solutions at unparalleled system performance. The Delta39K family is designed to combine the high speed, predictable timing, and ease of use of CPLDs with the high densities and low power of FPGAs. With devices ranging from 15,000 to 200,000 usable gates, the family features devices ten times the size of previously available CPLDs. Even at these large densities, the Delta39K family is fast enough to implement a fully synthesizable 64-bit, 66-MHz PCI core.

CY7C6XXX Series Of USB Microcontrollers

Cypress offers the industry's broadest line of USB microcontrollers, as well as a full set of development tools, supporting cost-driven applications such as keyboards and mice, as well as high-performance application like printers, scanners, xDSL modems, and digital cameras. Cypress has a wide range of solutions for Low-Speed USB applications, Full-Speed USB Applications and USB Hub Applications. Temperature range, commercial (0°F ~ 70°F).

The CY7C63xxx is a family of 8-bit RISC One Time Programmable (OTP) microcontrollers. In addition, the microcontroller features 96 ~ 256 bytes of internal RAM depending on the device. The Cypress USB Controller accepts a 6-MHz ceramic resonator as its clock source. This clock signal is doubled within the chip to provide a 12-MHz clock for the microprocessor.

The CY7C64013 and CY7C64113 are 8-bit One Time Programmable microcontrollers that are designed for full-speed USB applications. The instruction set has been optimized specifically for USB operations, although the microcontrollers can be used for a variety of non-USB embedded applications.

The CY7C647XX (EZ-USB FX1™) is a family of full-speed highly integrated, USB Microcontrollers. the FX1 family integrates the USB transceiver, serial interface engine (SIE), enhanced 8051 microcontroller, and a programmable peripheral interface in a single chip. The General Programmable Interface (GPIF) and Master/Slave Endpoint FIFO (8- or 16-bit data bus) provides an easy and glueless interface to popular interfaces such as ATA, UTOPIA, EPP, PCMCIA, and most DSP/processors.

The CY7C65 Series offers high-performance, fixed-function Universal Serial Bus (USB) hub devices which comply with USB Specification, Revision 1.1. Up to four downstream USB ports are available to expand the USB attachment points available in your PC system. These self-contained devices require no firmware development for your design, thereby reducing the design risk associated with some microcontroller solutions. These Application-Specific Standard Products (ASSP) can improve time-to-market in a number of USB designs, including standalone hubs, motherboard hubs, and monitor hubs.

The CY7C68013-56PVC (EZ-USB FX2) is a single-chip integrated USB 2.0 Transceiver, Serial Interface Engine (SIE), and Enhanced 8051 Microprocessor, High Speed 480Mbits/sec. Enhanced 8051 microcontroller, and a programmable peripheral interface in a single chip. Integrated I^2C-compatible controller, runs at 100 or 400 kHz, 48-MHz, 24 MHz, or 12 MHz 8051 operation. Four integrated FIFOs, brings glue and FIFO inside for lower system cost. Automatic conversion to and from 16-bit buses, master or slave operation. FIFOs can use externally supplied clock or asynchronous strobes. Easy interface to ASIC and DSP ICs, up to 40 general purpose I/Os.

The SL811HS is a single-chip, dual-speed USB Embedded Host controller that can operate as either a USB Host or USB peripheral device. The SL811HS can interface to devices such as microprocessors, microcontrollers, DSPs or directly to a variety of buses such as ISA, PCMCIA and others.

Developer Kits

CY3674

The development kits for the EZ-USB FX1™ family provide complete hardware and software solutions for accelerating the firmware and device driver development for all the products in the family. The development kits use the actual silicon for the entire development. Cypress's software utilities and example of firmware allow the user to generate USB traffic in hours, not weeks! Cypress includes an evaluation version of the 8051 Keil Software Tools in the Full Speed USB 2.0 development kit. The evaluation version of the C-Compiler lets the designer write 8051 microcontroller applications in C and still get the efficiency and speed of assembly language. Advanced features from Keil Tools include the ability to single step through code. This makes it easy to detect errors, handle source level debugging, and set breakpoints. With the ability to debug code one line at a time and to quickly compile and one-step download new code, developers have a more efficient means to complete firmware faster than using emulators. The supplied Keil Tools are fully functional, but are limited in object size to 4 kilobytes.

Devices Supported:

Microcontrollers 8-Bit 8051-Compatible

The 8051 microcontroller family remains one of the most popular processors in the world. Its ease of use and relatively high performance make it ideal for many applications, including portable and handheld products. The introduction of a new line of high-performance derivatives has many positive implications for improving the power efficiency of 8051-based designs. First, the use of a high-speed 8051 microcontroller can significantly improve power efficiency. A high performance CPU allows the processor clock to be slowed, resulting in the same level of performance at less power. Alternatively, the performance of an existing system can be increased without increasing power consumption. Second, a device which incorporates all needed peripherals should be selected if possible. This includes program memory, which is not commonly considered a peripheral. If extra data memory is required, a device such as the DS87C520 should be used, which incorporates 1 Kbyte of internal MOVX SRAM. One of the strengths of the 8051 product family is the wide variety of on-chip peripherals. Features such as watchdog timers, additional UARTs, and precision reset circuits are available on high-speed microcontrollers. The introduction of two new low-power modes provides a low-power alternative to the Idle mode. In addition to reducing current consumption, Power Management Modes such as those used in the DS87C520 High-Speed Microcontroller allow the processor to perform tasks such as polling while in a low state. Conventional 8051 architectures require the processor to operate at the maximum clock rate, even if only minimal processing power is required.

Soft Microcontroller Module

DS5000(T) Soft Microcontroller Module is a fully 8051-compatible 8-bit CMOS microcontroller that offers “softness” in all aspects of its application. This is accomplished through the comprehensive use of nonvolatile technology to preserve all information in the absence of system Vcc. The internal program/data memory space is implemented using either 8 or 32 K-bytes of nonvolatile CMOS SRAM. Internal data and key configuration registers are also nonvolatile. An optional real time clock gives permanently powered timekeeping. The clock keeps time to a hundredth of a second using an onboard crystal. **DS2250-32** has the same features as the DS5000 but with an added feature. The program/data memory space is implemented using 8, 32, or 64 Kbytes of nonvolatile CMOS SRAM. An optional real time clock gives permanently powered timekeeping. The clock keeps time to a hundredth of a second using an on-board crystal. ***Note:*** All nonvolatile memory and resources are maintained for over 10 years at room temperature in the absence of power.

LPC2000/8051 Microcontrollers

LPC2000 ARM 7 Microcontrollers

The LPC2000 architecture is based on a 16/32 bit ARM7TDMI-S™ CPU with real-time emulation and embedded trace support. A 128 bit wide memory interface and a unique accelerator architecture enable 32 bit code execution at maximum clock rate. For critical code size applications, the alternative 16-bit Thumb™ mode reduces code by more than 30% with minimal performance penalty. Due to their tiny size and low power consumption, these microcontrollers are ideal for applications where miniaturization is a key requirement. **Features:** • 16/32 bit ARM7TDMI-S processor • Up to 8/16/32/40/64 kB on-chip Static RAM • In-System Programming (ISP) and In-Application Programming (IAP) via on-chip boot loader software • Vectored Interrupt Controller with configurable priorities and vector addresses • Embedded ICE-RT interface enables breakpoints and watch points. Interrupt service routines can continue to execute whilst the foreground task is debugged with the on-chip RealMonitor™ software. • Embedded Trace Macrocell enables non-intrusive high speed real-time tracing of instruction execution • Multiple serial interfaces

OMAP — ARM9 + C55x

OMAP Processors integrating the command and control functionality of ARM, coupled with low-power, real-time signal processing capabilities of a DSP. The OMAP59xx platform is ideal for portable data terminal applications such as portable medical devices (portable defibrillation, home medical test and analysis) asset and inventory management, (parcel tracking and location, stock inventory and replenishment, real-time data capture with analysis and interpretation) and point of sale (sales and membership processing, merchandising and pricing management verification and authentication) It enables embedded developers to program using familiar development environments by supporting leading operating systems such as Microsoft® Windows® CE.NET, Linux®, and TI's DSP/BIOS real-time scalable kernel. This open development environment makes it possible for designers to deliver innovative products to the market faster, utilizing familiar tools, a standard application programming interface (API) and a seamless interface to the DSP through an optimized interprocessor communication mechanism. The built-in interprocessor communication mechanism eliminates the need for developers to program the RISC and DSP independently resulting in reduced programming efforts.

DAP Signal Conditioning Boards

The DAPSigCndBrdBPEVM can be used with Data Acquisition Products (DAPs), 5-6K Interface and C2000 Interface boards. This signal conditioning board, provides up to eight single ended or four differential conditioning channels for use with a wide selection of data converter evaluation boards. The DAPSigCndBrdBPEVM board has four dual supply OPA2132 operational amplifiers that operate at +/- 15 volts. Low Cost Field Programmable Microcontroller Peripherals

The low cost PSD3XX family integrates high-performance and user-configurable blocks of EPROM, programmable logic and optional SRAM into one part. The PSD3XX products also provide a powerful microcontroller interface that eliminates the need for external "glue logic". The part's integration, small form factor, low power consumption and ease of use make it ideal for interfacing to virtually any microcontroller.
Major functional blocks of the PSD3XX: • Two programmable logic arrays • 256Kb to 1Mb of EPROM • Optional 16Kb SRAM • Input latches • Programmable I/O ports • Page logic • Programmable security

The ZPSD3XX has improved technology that helps reduce current consumption using the Turbo bit. Excellent if you require a 5V version of the PSD3XX that uses less power.

Microcontrollers

For the mass market ST offers several families of microcontrollers, e.g. the ST62, the ST7 and the ST9 ranges, with the result that there is a ST microcontroller to suit every kind of application, from those where minimum cost is the primary requirement to those that need powerful real-time performance and high-level lang uage support. The recently introduced ST FIVE family integrates all the benefits of microcontrollers, together with a dedicated architecture, the "Decision Processor", oriented to high-level algorithms and a visual programming approach. ST also offers the innovative Programmable System Memory (FlashPSD, DSM) products, which combine memory functions such as Flash, EEPROM and SRAM with programmable logic on a single chip. Designed to interface with all standard microcontrollers to provide a complete system implementation, Programmable System Memories can be quickly and easily programmed without special manufacturing equipment, even in the field.

Little Doesn't Have to Mean Limited — *THINK BIG.*
Freescale's New RS08 Core and its MC9RS08KA 8-bit MCU

RS08 Core

The RS08 core is a reduced version of the S08 central processing unit (CPU) that has been specifically designed for small pin-count devices with under 16KB memory. Thirty percent smaller than the S08 CPU, it is more efficient and cost-effective for simple electro-mechanical devices that are migrating to fully solid-state electronic operation or portable devices that have evolved into smaller or even disposable versions.

MC9RS08KA2/1

Need an ultra low-end 8-bit MCU that won't say "no" to whatever your imagination dreams up?

With more on-board flash memory than competing devices, our 8-bit MC9RS08KA microcontroller (MCU) offers endless possibilities for designers facing constant challenges of shorter windows of opportunity, very large sales volumes that require low priced bill of materials (BOM) and scarce board space. This 6-pin device addresses all of these concerns with a simple design, cost-effective pricing and a tiny 3 mm x 3 mm dual flat no-lead (DFN) package option. Two 8-pin packages are also available. KA is ideal for small, energy efficient applications.

Applications

- High-brightness LED
- Lighting systems control
- Toys
- Small handheld devices
- Space-constrained applications
- Small appliances
- AC line voltage monitoring
- Simple logic replacement
- Analog driver replacement
- ASIC replacement

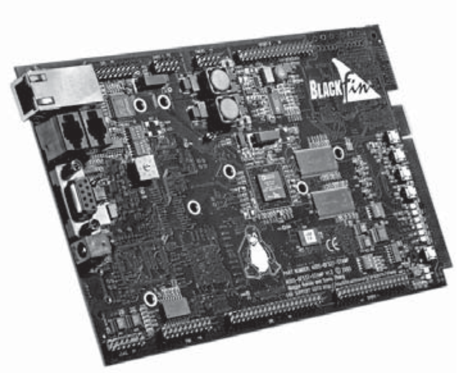
Blackfin is Embedded Linux

STAMP uClinux Kernel Board Support Package for the Analog Devices ADSP-BF537 Blackfin Processor



The ADSP-BF537 STAMP Board Support Package (BSP) provides developers with a cost effective environment to develop embedded systems with the Blackfin® Processor. The STAMP BSP has been specifically designed to support the development and porting of open source uClinux applications and includes the full complement of memory along with serial and network interfaces.

The BSP includes an ADSP-BF537 STAMP board and a CD with a recent copy of the Blackfin open source development tools and uClinux Kernel, documentation, board schematics, gerbers, and layout files. There are several Analog Devices daughter cards available for use with the STAMP board. Three separate SPI ADC daughter cards are available - AD7476, AD7476A, and AD7940 - each one providing an analog input interface. In addition, an AD1836 daughter card is available that provides an audio interface. Look out for additional daughter cards in the future with various other interfaces such as video and analog input/output.

For the most recent versions of tools and documentation, visit the uClinux for Blackfin web site: http://blackfin.uclinux.org. This web site is the central repository for all Blackfin open source projects. Several projects based on the STAMP board and daughter cards are posted here including: a networked audio media node, a networked oscilloscope, and a port of Linphone using the Speex voice codec.

The ADSP-BF537 STAMP BSP will have you up and running with uClinux on the Blackfin right out of the box.

Part Number: ADDS-BF537-STAMP

Emulators

Analog Devices offers two High Performance (HP) emulator options for the Blackfin Processor. The HP PCI based emulator and the HP USB 2.0 based emulator deliver seamless exchange of real-time data from the host to the target application. These emulators are designed to take advantage of advanced features, such as the Background Telemetry Channel (BTC), a non-intrusive method for exchanging data between the host and target application without affecting the target system's real-time extended support characteristics.

Analog Devices also offers a USB 1.0 based emulator for the Blackfin Processor. This emulator offers the ease of use and portability associated with USB technology at a reduced price point.

Blackfin Test Integration Toolkit for NI LabVIEW

National Instruments LabVIEW toolkit provides a high level method for easily building test systems and utilities for Blackfin Processor systems.

By integrating testing, engineers can iteratively verify their design throughout the development process.

Early use of the Test Integration Toolkit reduces overall development time and improves the quality of products that use the Blackfin Processor.

LabVIEW Embedded Module for Blackfin Processors

The NI LabVIEW™ Embedded Module for Analog Devices Blackfin® Processors is a comprehensive graphical development environment for embedded design.

Jointly developed by ADI and NI, this module seamlessly integrates the LabVIEW Development Environment and Blackfin Embedded Processors.

Included in the LabVIEW Embedded Module is everything required to develop your application quickly in LabVIEW and ultimately target a custom-developed hardware solution, taking designs from concept to production in a single integrated development environment.

By using this approach, engineers and scientists can achieve faster development times, lower development cost, and still deliver a high performance embedded processing solution.

16-BIT PERFORMANCE / 8-BIT COST

Microcontrollers in the H8/36077 Group

H8/36077 MCUs are application-optimized, lower-cost additions to the popular H8/Tiny family of devices. Their 20MHz 16-bit H8/300H CPU core has a 32-bit load-store architecture and sixteen 16-bit configurable general registers; it runs sixty-two 16-bit instructions that provide high code density and allow efficient C/C++ programming. Thus, these four new MCUs free you from the limitations of 8-bit devices. Their extensive set of peripheral functions enable single-chip embedded system designs. The devices provide well-chosen flash and mask-ROM memory options and are available in lead-free 64-pin QFPs and LQFPs, priced to meet tight cost budgets.

OPTICHRON

Analog-to-Digital Converters

Optichron's high performance 14-bit, 80 to 125 MSPS data converter modules in BGA form factor powered by Turbolinear™ technology offer ultra-high linearity for designs requiring a critical boost in ADC performance.

The advanced buffer-amplifier plus analog-to-digital converter modules not only provide system designers much-valued linearity but also a greater command of design tradeoffs between speed, performance power dissipation and cost.

By eliminating a key performance constraint, nonlinear distortion in the buffer amp and ADC, our ultra-linear modules, powered by our Turbolinear technology, offer design engineers high signal fidelity at very high signal frequencies while increasing system speed and improving analog performance.

OM1400A-105

This is a high-speed and high-performance analog-to-digital converter module optimized to achieve and exceptionally high linearity when digitizing signals of very high IF.

Evaluation Board for CS8416 and CS8406

The CDB8416 is designed to allow easy evaluation of the CS8416 and CS8406. The board is designed for easy connection to an Audio Precision or other digital audio test system.

Input and output data may be set for either balanced using the XLR connectors or unbalanced using the coax or optical connectors.

Windows PC software provides a GUI to make configuration easy in software mode. The software communicates through the PC's parallel port to control the internal registers so that all the possible software modes of the CS8416 may be tested.

Features:

• CS8416 Digital Audio Receiver • Receives and transmits AES/EBU, S/PDIF and EIAJ-340 compatible digital audio • Analog and Digital 3.3 V Supply • 3.3 to 5.0 V Logic Interface Supply • Operates in stand alone Hardware Mode or computer controlled Software Mode • Balanced and unbalanced inputs available.

598-1017-ND (CDB8416) **$688.50**

Evaluation Board for CS8421

The CDB8421 demonstration board is an excellent means for evaluating the CS8421 sample rate converter. System timing can be provided by the CS8421, by the CS8416 phase-locked to its S/PDIF input, by an I/O stake header or by an on-board oscillator. Digital I/O is available via coaxial (RCA) or optical connectors to the CS8416 and SC8406. All configuration control is handled from onboard switches.

Features:

• CS8416 S/PDIF Digital Audio Receiver • CS8406 S/PDIF Digital Audio Transmitter • Header for External Serial Audio I/O • 3.3 to 5.0V Logic Interface • No software required to operate
